

CLOSING BLOCK · 30 MIN

Q&A, Exam Briefing & Next Steps

Claude Code Bootcamp · Day 1 · Closing the loop

Promise

In 30 minutes you will:

- 1 Spot the **5 most common mistakes** AI-paired developers make
- 2 Avoid the **prompting anti-patterns** that wreck loops
- 3 Understand the **certification rules** (40/40/20, 70% pass)
- 4 Walk out with a **Monday morning plan** to keep momentum

Why this matters

The hour you spend right now is the difference between "interesting workshop" and "habit that ships software".

- Today you wrote code with Claude.
- Tomorrow you have to do it **alone, on a deadline, on your own repo.**
- The closing block locks the loop: mistakes, fixes, certification, what to do next.

If you skip this block you'll leave with technique and no system.

Concepts

Three frameworks that travel with you:

Framework	Use when	Source
Plan → implement → test → review → commit loop	Every non-trivial change	Module 1
40/40/20 evaluation rubric	Grading any AI output	Module 5 + Assessment
12-item production-readiness checklist	Before tagging a release	Module 10 + skills/release-readiness

Each framework is a **checklist**, not a vibe. Print them.

Live demo flow

3 anti-patterns, demonstrated and fixed in 8 minutes:

- 1. The "fix it" loop** — vague prompt → unfocused diff → re-prompt → drift.
Fix: paste the exact error + the smallest reproducer.
- 2. The over-eager agent** — long autonomous run → wrong abstraction → 600-line diff.
Fix: stop at the plan, review, **then** implement.
- 3. The merged-without-review commit** — Claude writes commit + push in one shot.
Fix: review-before-commit, even when it's "obviously fine".

Each fix is a **shorter prompt**, not a longer one.

▶ Mini project

Open the repo you came in with (your own project, not the bootcamp).

STEP 1 Pick **one** change you've been putting off (a refactor, a test, a doc).

STEP 2 Apply the 5-step loop with Claude Code, **on the clock — 15 minutes**.

STEP 3 Stop at the commit. Do not push.

Success: you have a reviewable diff and a one-paragraph summary of what changed.

▶ Step-by-step lab

If you don't have your own repo ready, use today's deliverables:

STEP 1 Open `exercises/part-10/` and run `skills/release-readiness/SKILL.md` against any module deliverable from today.

STEP 2 Produce the 12-item table.

STEP 3 Decide GO / NO-GO with a one-sentence justification.

Time-box: 12 minutes.

Suggested Claude Code prompts

1. Loop reset when Claude drifts

"Stop. Show me the next single step you intend to take and why. Do not write code yet."

2. Self-review before commit

"You are reviewing a stranger's PR. List every potential bug, ranked by severity. Smallest patch each."

3. Honest readiness verdict

"Walk my last commit through the 12-item production-readiness checklist. End with GO or NO-GO and a list of blocking item numbers."

Deliverable checklist

- ☐ One mini-deliverable (today's lab OR your own repo) reviewed
- ☐ GO / NO-GO verdict written down
- ☐ Knowledge quiz attempted (`assessments/knowledge-quiz.md`)
- ☐ Practical task chosen (`assessments/practical-task.md`)
- ☐ Code-review reflection drafted (`assessments/code-review-reflection.md`)

Definition of done

You are "done" with the bootcamp when:

1. The three assessment artefacts are in your submission zip.
2. Your weighted score against `assessments/rubric.md` is $\geq 70\%$.
3. You can name, from memory, the **5 May 2026 pillars**: Skills · Hooks · MCP · GitHub Actions · Multi-agent.
4. You have a one-sentence answer to "*What will I try in my own repo on Monday?*"

Review checkpoint

Go around the room (or chat) and complete this sentence:

"On Monday, I will use Claude Code to ____ on my project ____ , and I will stop the loop when ____ ."

If you can't finish the sentence, re-watch the Part 9 recording before submitting.

Common mistakes

The five we see every cohort:

1. **No plan slide** — jumping straight into "write the function".
2. **Skipping the review pass** — accepting the first diff.
3. **Letting Claude commit** — losing the human checkpoint.
4. **Treating skills as files** — instead of habits invoked deliberately.
5. **No CLAUDE.md** — Claude has no project context, you re-pay onboarding cost every session.

Each maps to a module: 1, 5, 6, 9, 3.

Instructor notes

Cut-line if running short:

- **Cut first:** the "Step-by-step lab" slide (let students do it offline).
- **Keep:** Common mistakes, Definition of done, the Monday-morning sentence.
- **Never cut:** the assessment briefing — students need to know how grading works.

Cohort notes (2026-05-30 inaugural):

- Watch for a flat-energy room at this point; insert a 2-minute stretch.
- Hand out the certification template URL only after Q&A.

Transition

Three things, in this order, before you close your laptop:

1. **Upload** your zip to the Packt LMS.
2. **Star** the repo so you can find the skills library on Monday.
3. **Write** your Monday-morning sentence somewhere you'll see it (Slack DM to yourself works).

You have everything you need. Now ship.
